Announcements: Docs

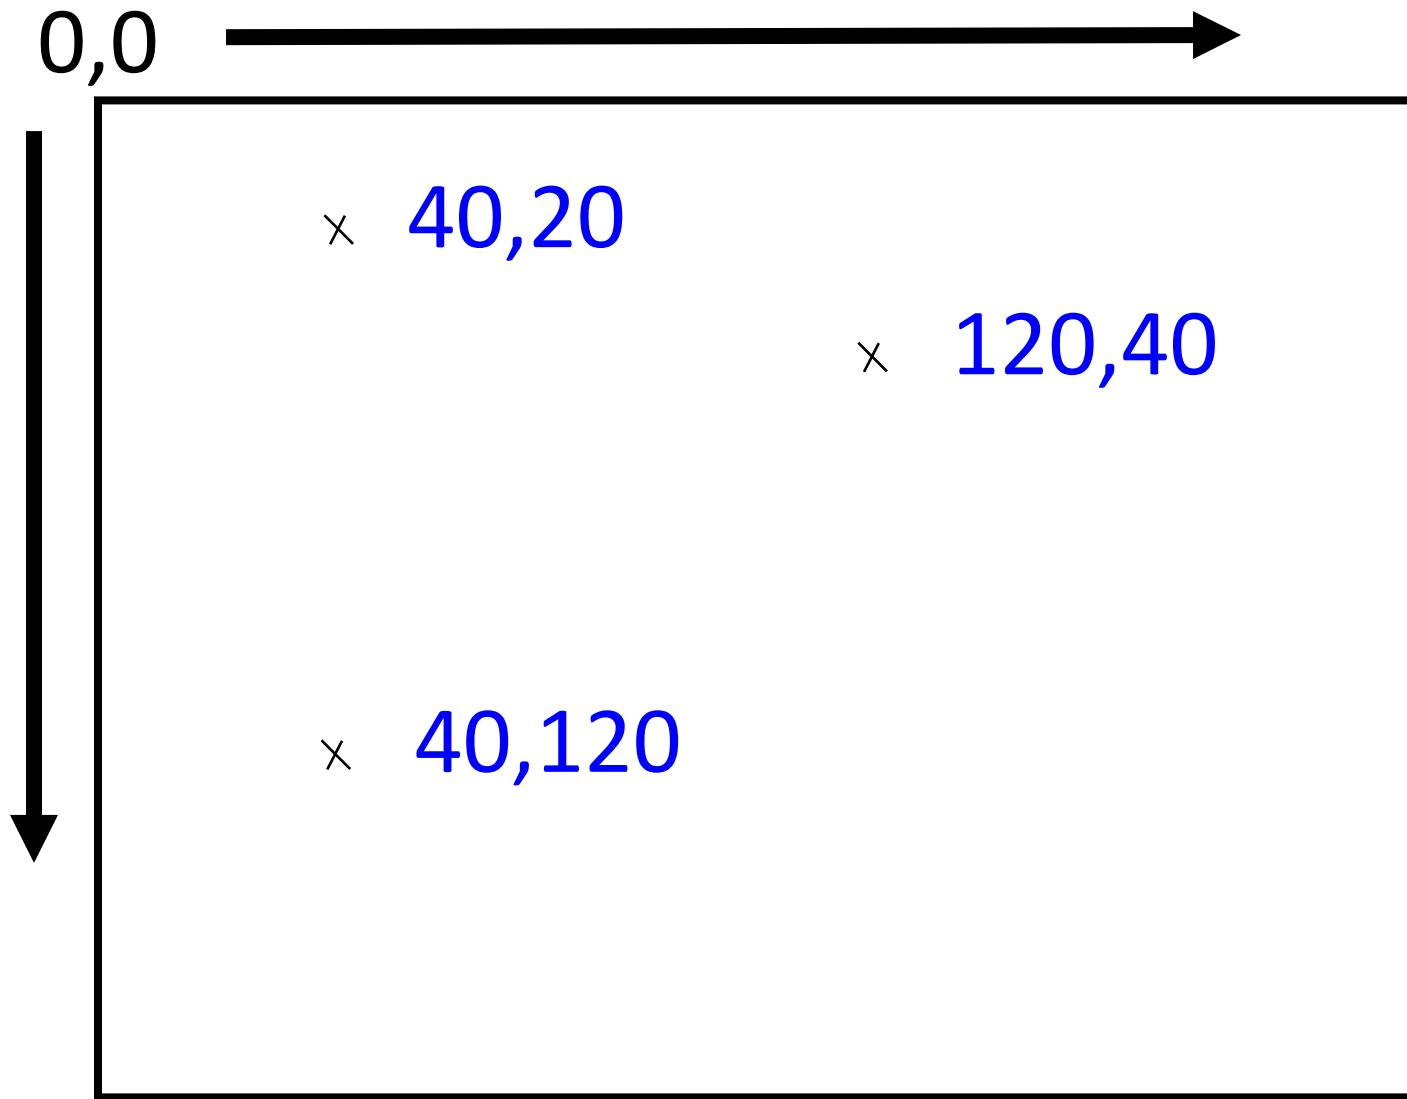

- Click the "Stanford Library Docs" link in the 106A website sidebar.
 - This site lists every kind of object in the Stanford libraries.
 - Click an object type on the left and see its behavior on the right.
 - These kinds of pages exist for Stanford libraries and standard Java.

The Graphics Canvas

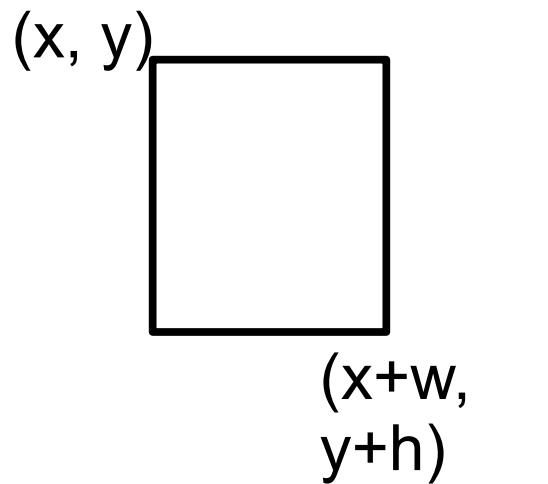

Collage Model

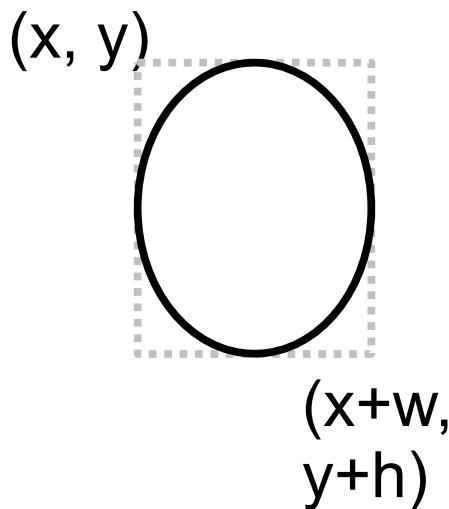

Graphical Objects

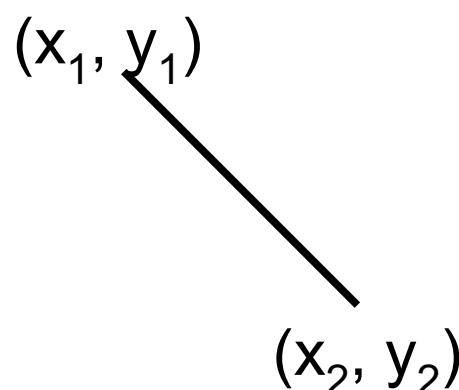

GRect

GOval

GLine

GLabel

Hello there!

GImage

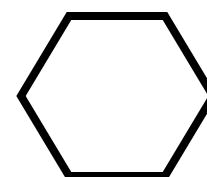

GArc

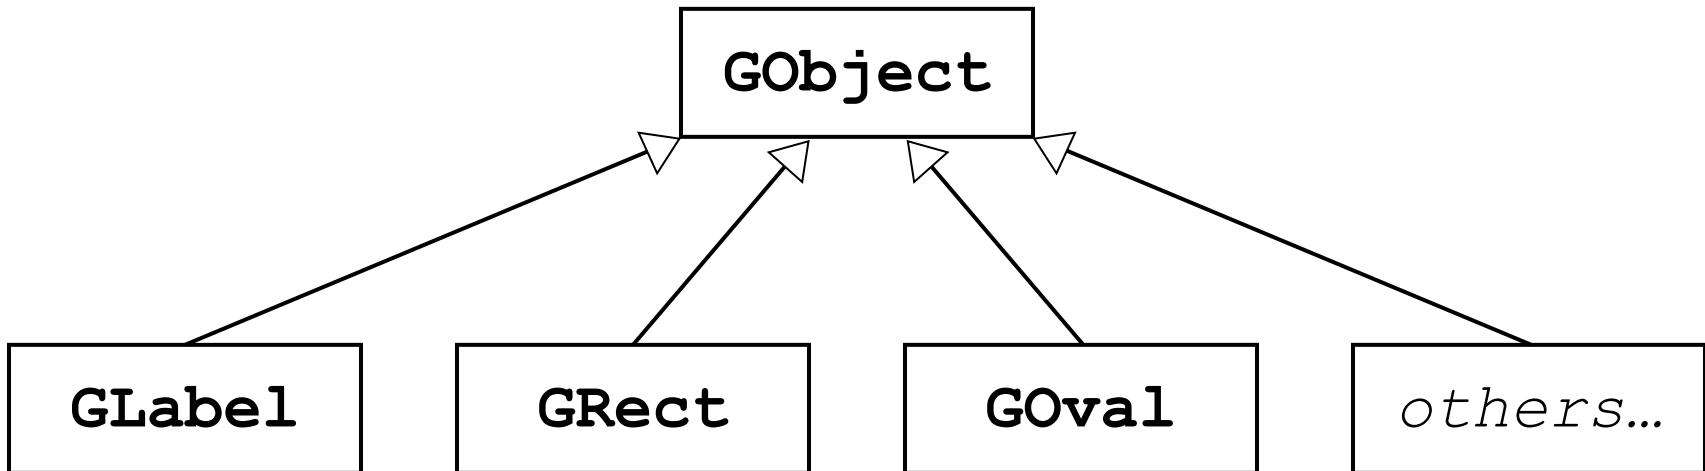

GRoundRect

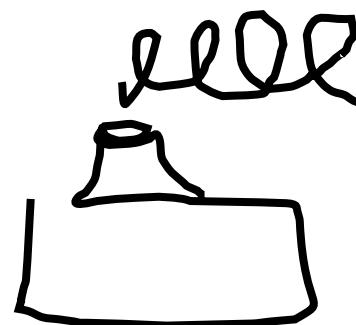

GPolygon

Graphical Objects

```
GRect myRect = new GRect(50, 50, 350, 270);
```

Primitives vs. Objects

Primitive Variable Types

int
double
char
boolean

Object Variable Types

GRect
GOval
GLine
Scanner

• • •

Object variables:

1. Have upper camel case types
2. You can call methods on them
3. Are constructed using **new**

Methods on Graphics Objects

We manipulate graphics objects by calling methods on them:

object.method(parameters);

The word "object" is in blue, "method" is in red, and "parameters" is in green. Below each word is a horizontal bracket. Below the first bracket is the text "Who?", below the second is "What?", and below the third is "What specifically?".

Who? What? What specifically?

Example:

rect.setColor(Color.RED);

GObject Methods

The following operations apply to all **GObjects**:

object . setColor (color)

Sets the color of the object to the specified color constant.

object . setLocation (x , y)

Changes the location of the object to the point (x, y) .

object . move (dx , dy)

Moves the object on the screen by adding dx and dy to its current coordinates.

object . getWidth ()

Returns the width of the object

object . getHeight ()

Returns the height of the object

and more...

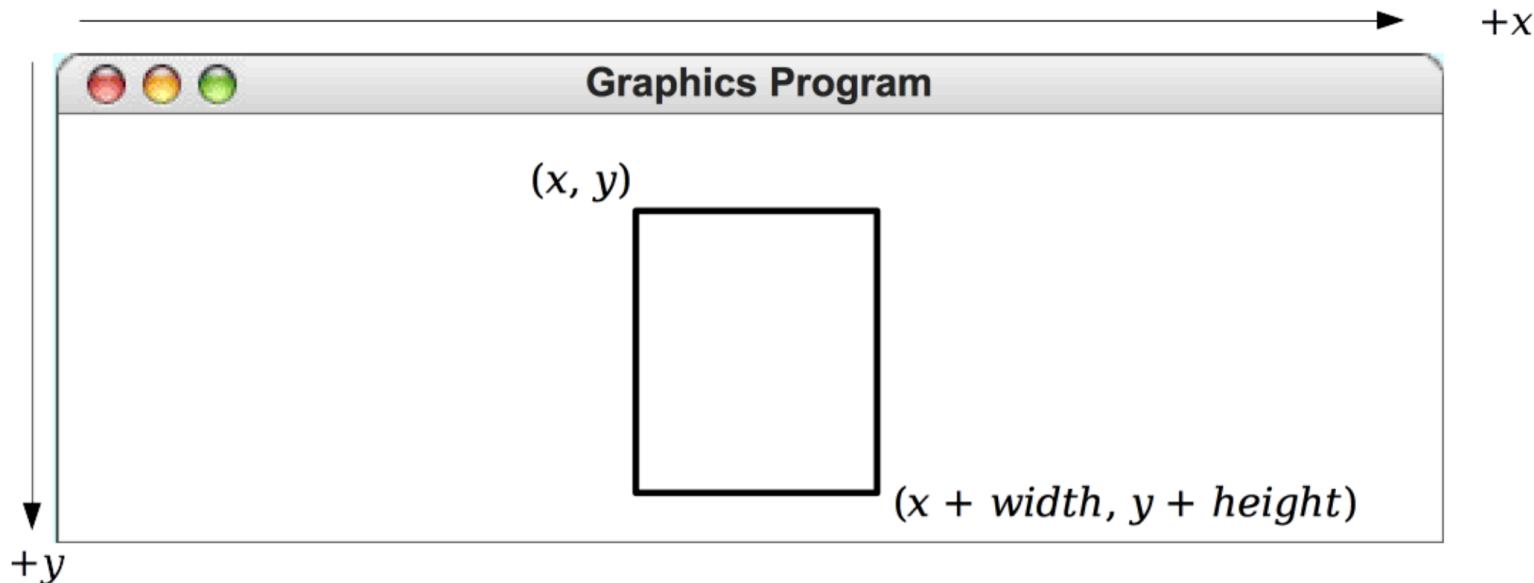

GRect

`new GRect(x, y, width, height);`

- Creates a rectangle with the given width and height, whose upper-left corner is at (*x*, *y*)

`new GRect(width, height);`

- Same as above, but defaults to (*x*, *y*) = (0, 0)

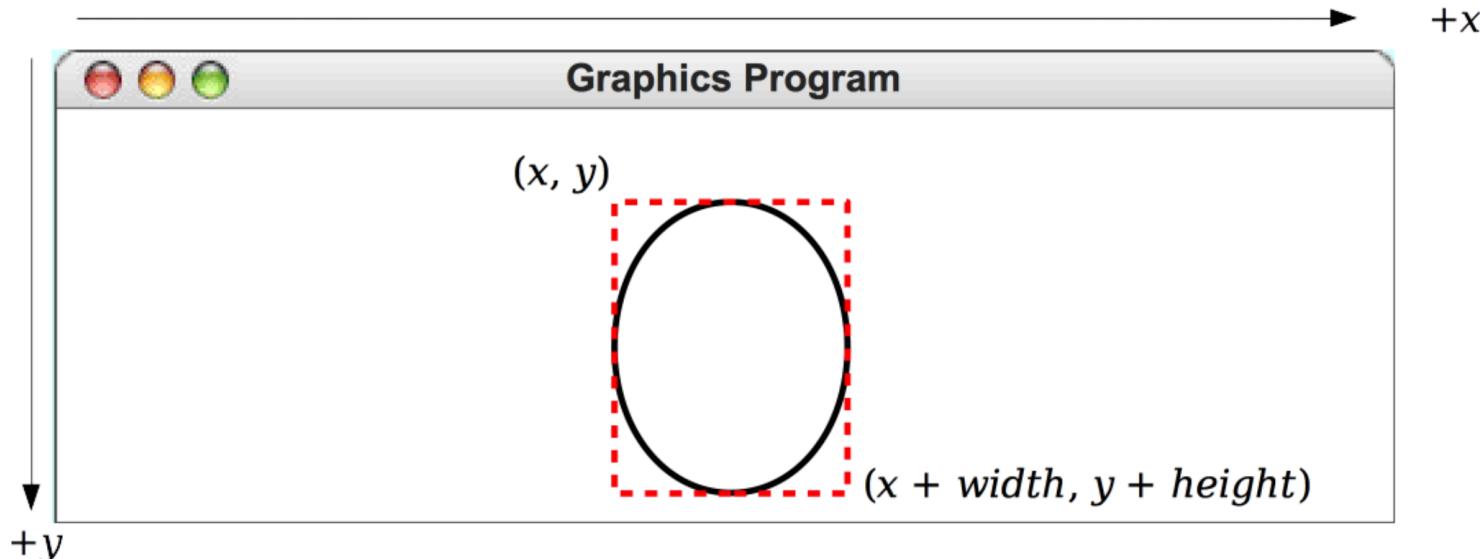

GOval

```
new GOval(x, y, width, height);
```

- Creates an oval that fits inside a rectangle with the given width and height, and whose upper-left corner is at (*x*, *y*)

```
new GOval(width, height);
```

- Same as above, but defaults to (*x*, *y*) = (0, 0)

GRect and GOval

Methods shared by the **GRect** and **GOval** classes

object . setFilled (fill)

If *fill* is **true**, fills in the interior of the object; if **false**, shows only the outline.

object . setFillColor (color)

Sets the color used to fill the interior, which can be different from the border.

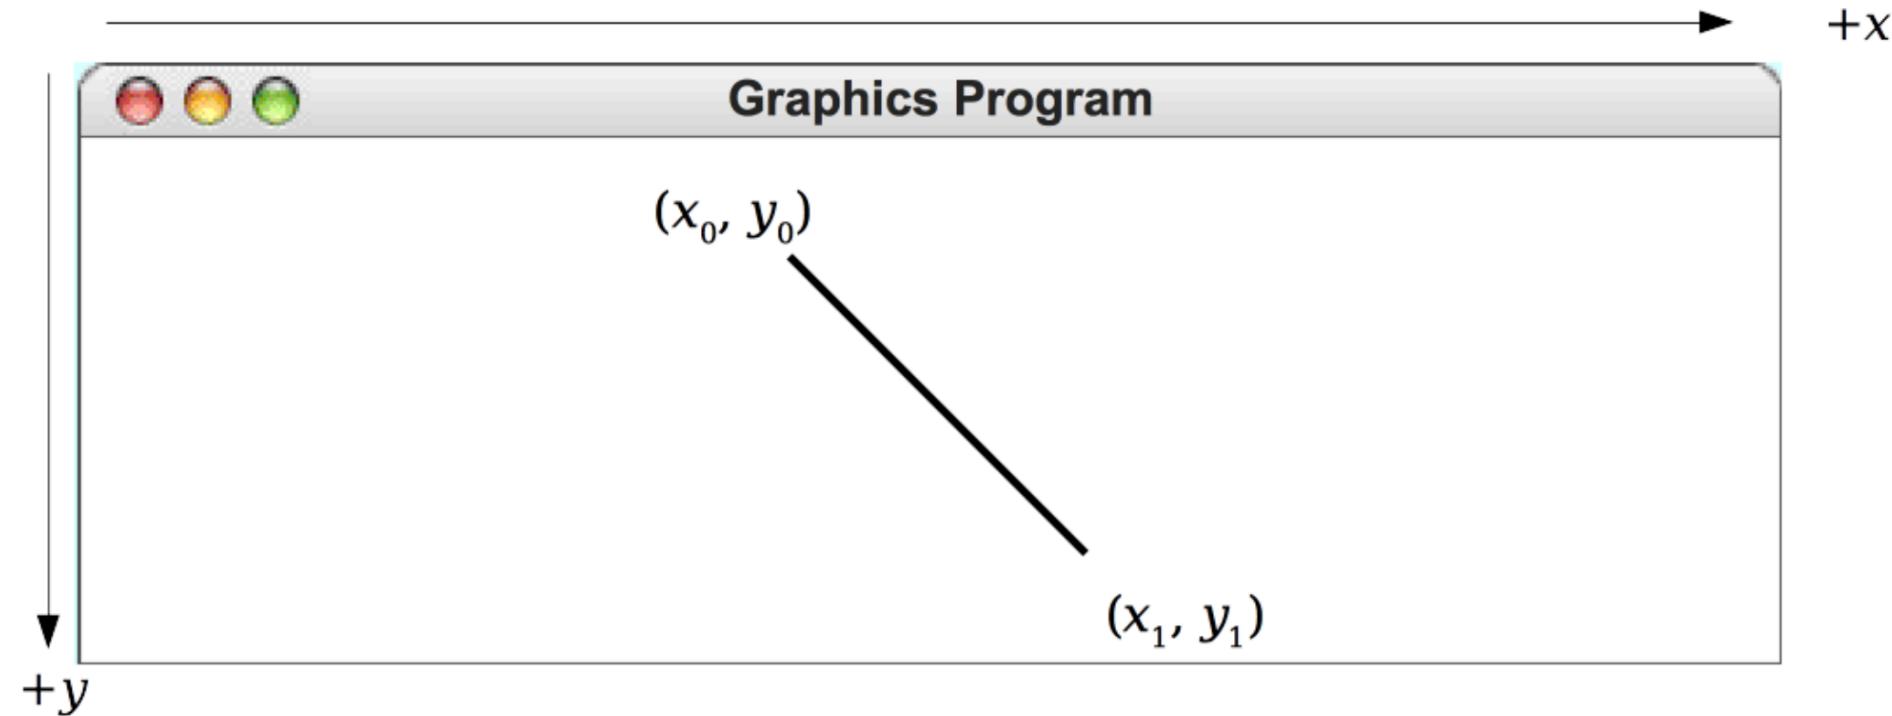

object . setSize (width, height)

Sets the object's size to be the given width and height

GLine

```
new GLine(x0, y0, x1, y1);
```

- Creates a line extending from (x_0, y_0) to (x_1, y_1)

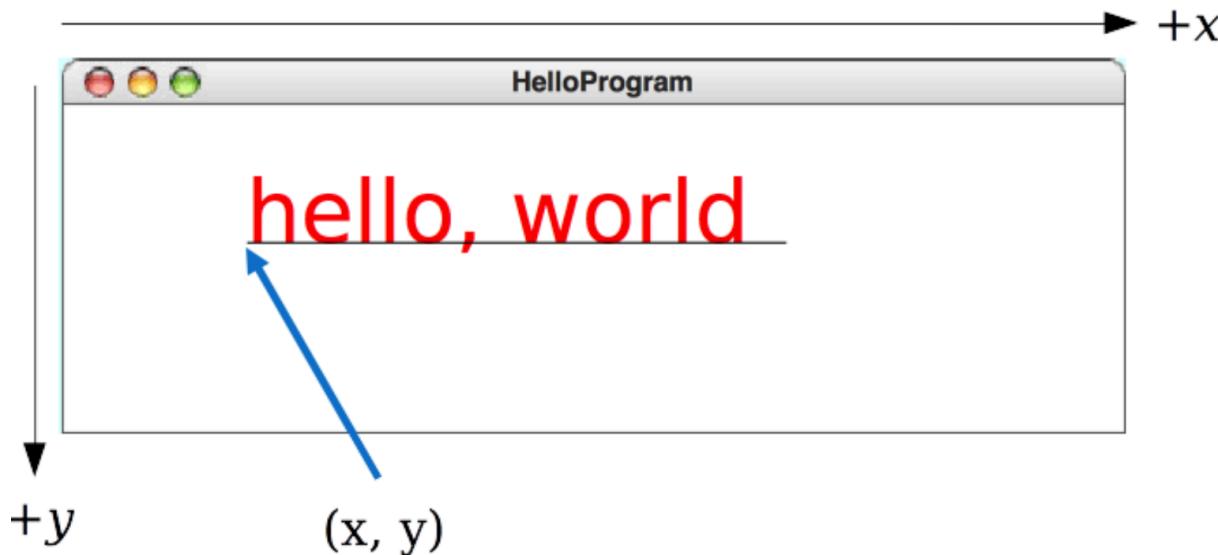

GLabel

```
new GLabel("your text here", x, y);
```

- Creates a label with the given text, whose **baseline** starts at (x, y). NOT positioned according to the top-left corner!

```
new GLabel("your text here");
```

- Same as above, but defaults to (x, y) = (0, 0)

GLabel Methods

Methods specific to the **GLabel** class

label.getDescent()

Returns the height of the label below its baseline.

label.getAscent()

Returns the height of the label above its baseline.

label.setFont(font)

Sets the font used to display the label as specified by the font string.

The font is typically specified as a string in the form

"*family-style-size*"

family is the name of a font family (e.g. "SansSerif")

style is either **PLAIN**, **BOLD**, **ITALIC**, or **BOLDITALIC**

size is an integer indicating the point size

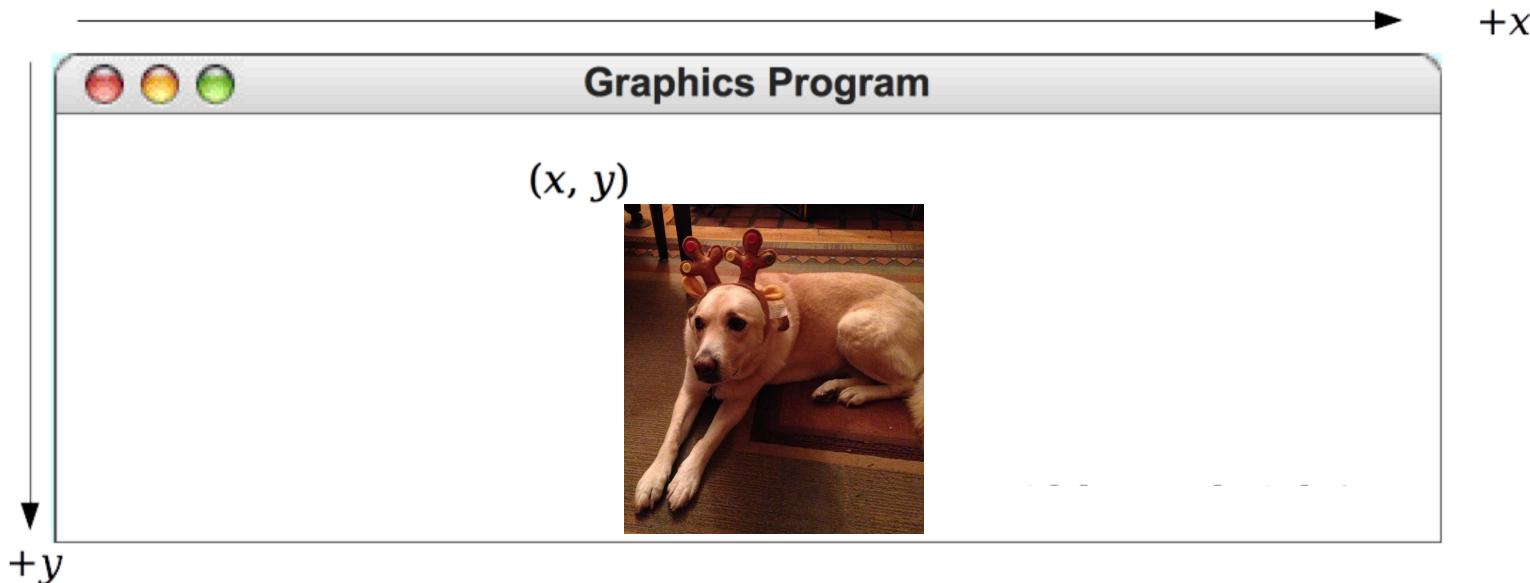

GImage

```
new GImage("your filename here", x, y);
```

- Creates a an image displaying the given file, whose upper-left corner is at (x, y)

```
new GImage("your filename here");
```

- Same as above, but defaults to (x, y) = (0, 0)

GImage Methods

*object . **setSize** (width, height)*

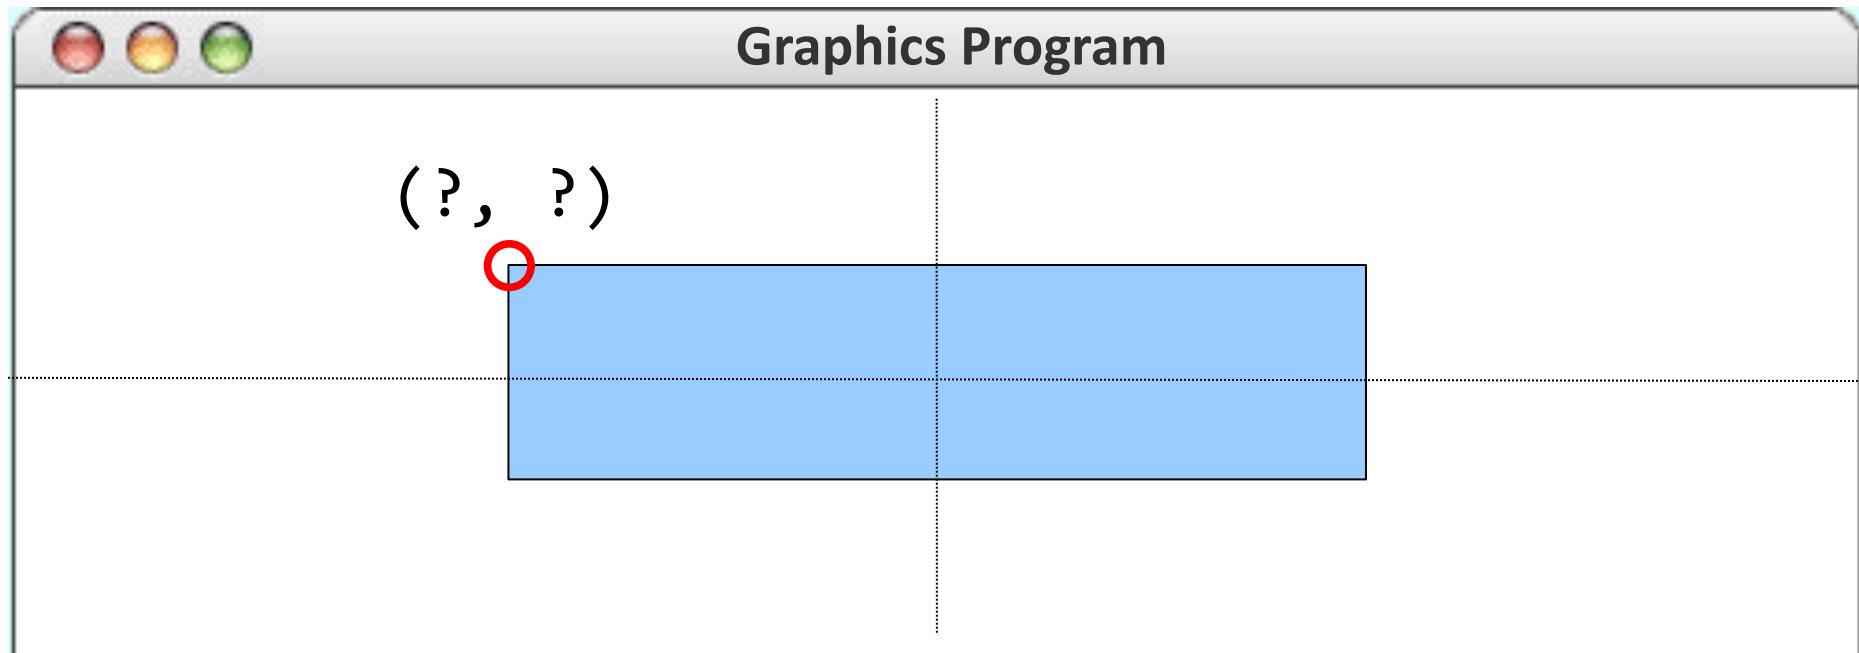

Sets the object's size to be the given width and height

GraphicsProgram Methods

- GraphicsProgram contains these useful methods:

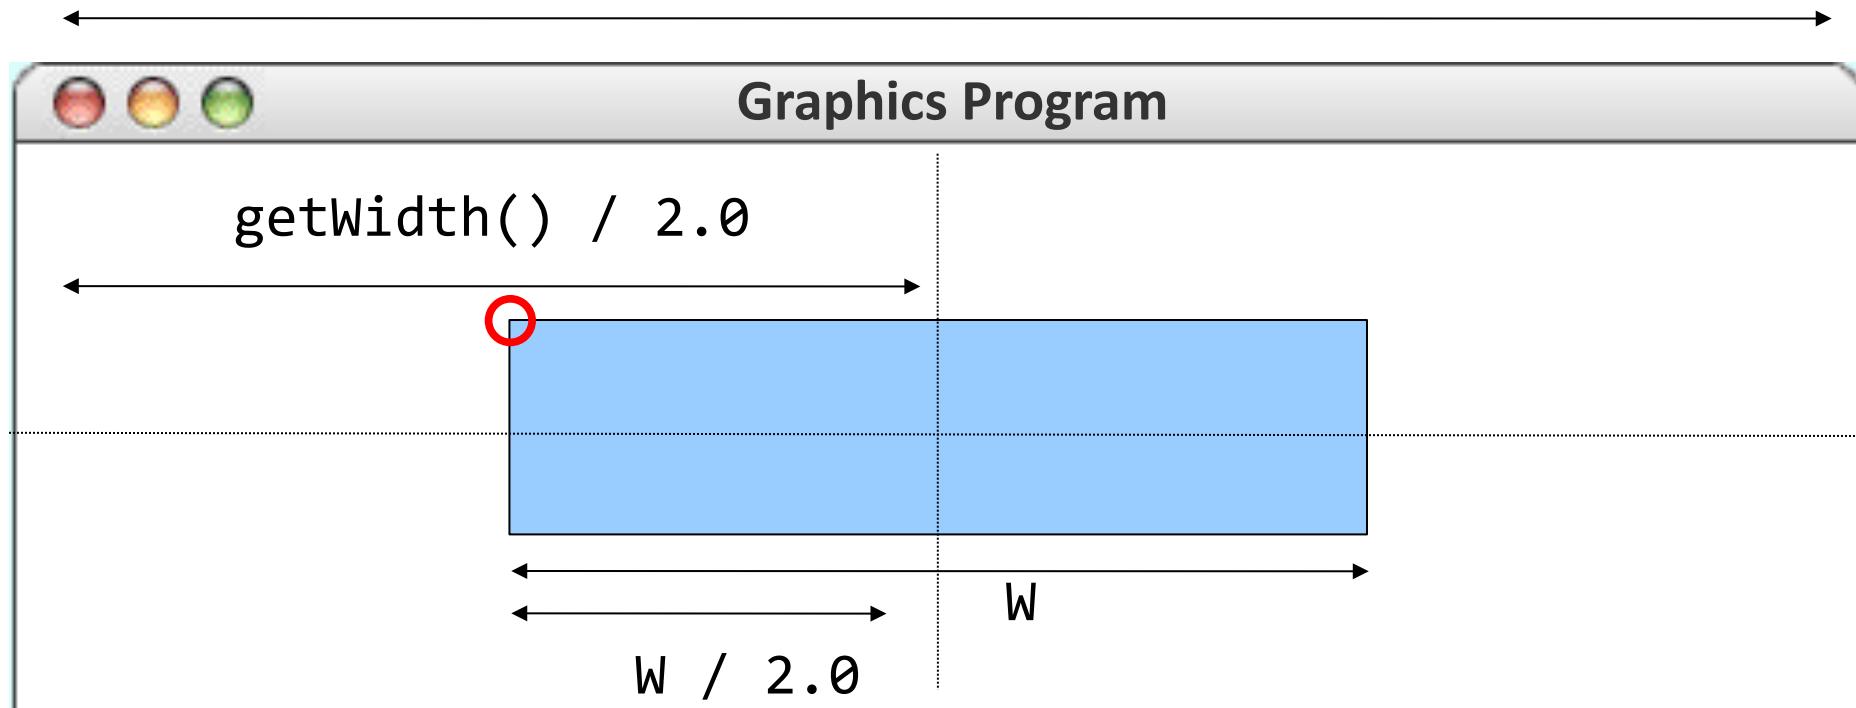

Method	Description
<code>add(<i>gobj</i>);</code> <code>add(<i>gobj</i>, <i>x</i>, <i>y</i>);</code>	adds a graphical object to the window
<code>getElementAt(<i>x</i>, <i>y</i>)</code>	return the object at the given (<i>x,y</i>) position(s)
<code>getElementCount()</code>	return number of graphical objects onscreen
<code>getWidth()</code> , <code>getHeight()</code>	return dimensions of window
<code>remove(<i>gobj</i>);</code>	removes a graphical object from the window
<code>removeAll();</code>	remove all graphical objects from window
<code>setCanvasSize(<i>w</i>, <i>h</i>);</code>	set size of drawing area
<code>setBackground(<i>color</i>);</code>	set window's background color

Recap Practice: Centering

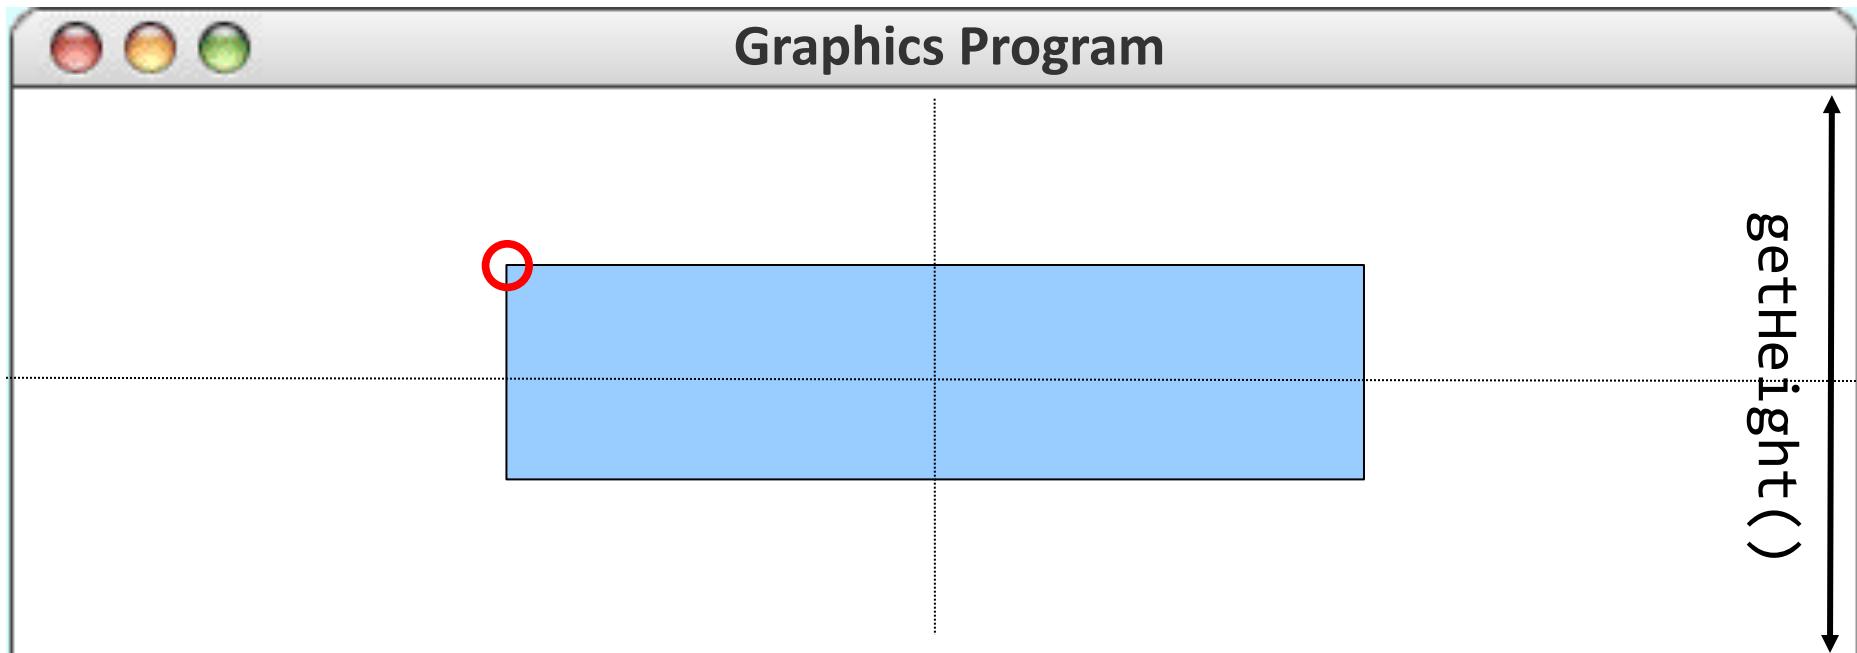

Recap Practice: Centering

getWidth()

rectangle's x value = $\text{getWidth}() / 2.0 - \text{W} / 2.0$

Recap Practice: Centering

rectangle's y value = getHeight() / 2.0 - H / 2.0

GCompound

A **GCompound** contains other GObjects. It's useful when you want to do one operation on multiple GObjects at the same time.

```
GCompound compound = new GCompound();
compound.add(shape);
compound.add(shape);
...
compound.add(shape);

add(compound);
```

- E.g. you can make a GCompound to represent a car.

GCompound

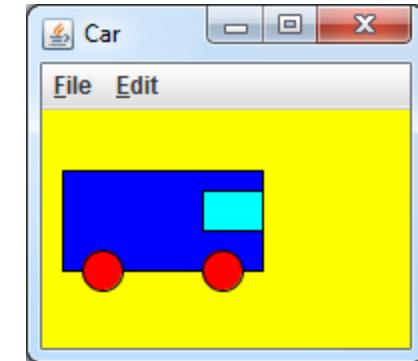

```
setBackground(Color.YELLOW);
GCompound car = new GCompound();

GRect body = new GRect(10, 30, 100, 50);
body.setFilled(true);
body.setFillColor(Color.BLUE);
car.add(body);

Goval wheel1 = new Goval(20, 70, 20, 20);
wheel1.setFilled(true);
wheel1.setFillColor(Color.RED);
car.add(wheel1);

Goval wheel2 = new Goval(80, 70, 20, 20);
wheel2.setFilled(true);
wheel2.setFillColor(Color.RED);
car.add(wheel2);

GRect windshield = new GRect(80, 40, 30, 20);
windshield.setFilled(true);
windshield.setFillColor(Color.CYAN);
car.add(windshield);
add(car);      // at 0,0! Where we want this “sub-canvas” to go
```

Graphics Program “Getters”

- Methods of graphical objects that return values:

Method	Description
<i>obj.getColor()</i>	the color used to color the shape outline
<i>obj.getFillColor()</i>	the color used to color the shape interior
<i>obj.getX()</i>	the left x-coordinate of the shape
<i>obj.getY()</i>	the top y-coordinate of the shape
<i>obj.getWidth()</i>	number of pixels wide the shape is
<i>obj.getHeight()</i>	number of pixels tall the shape is

- Example: Swapping the x/y coordinates of a shape:

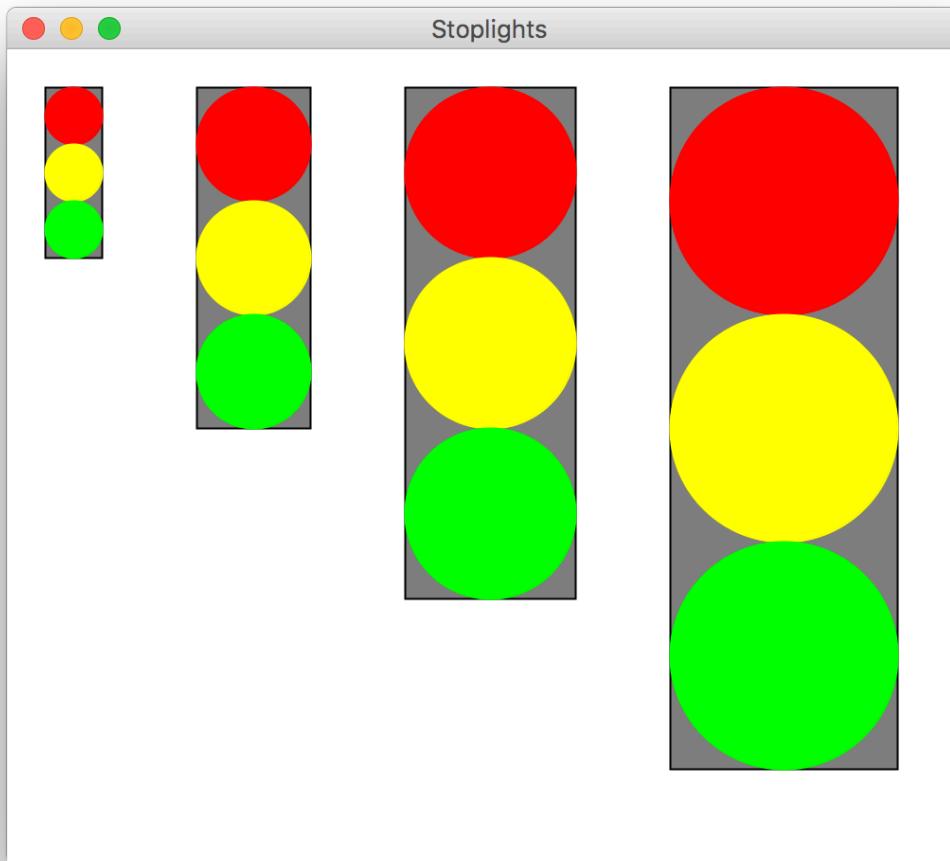

```
GRect rect = new GRect(...);  
...  
int rx = rect.getX();  
int ry = rect.getY();  
rect.setLocation(ry, rx);
```

Practice: Stoplights

How would you make a method for drawing stoplights of different locations and sizes?

Practice: Stoplights

What information
do we need in
order to draw this?

Extra Practice: Line Art

Write a graphical program **LineArt** that draws a series of lines (see lecture code for solution):

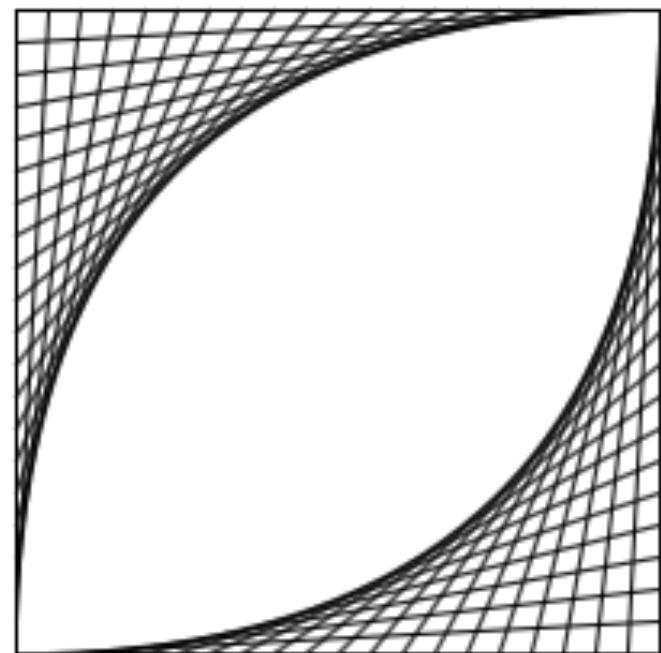

- Outer square is at (10, 30) and size 200x200
- each line is 10px apart in each dimension

coordinates of top-left lines:

- (210, 30) to (10, 30)
- (200, 30) to (10, 40)
- (190, 30) to (10, 50)
- ...
- (20, 30) to (10, 220)

coordinates of bottom-right lines:

- (210, 30) to (210, 230)
- (210, 40) to (200, 230)
- ...
- (210, 220) to (20, 230)

- Practice: Checkerboard

Practice: Checkerboard

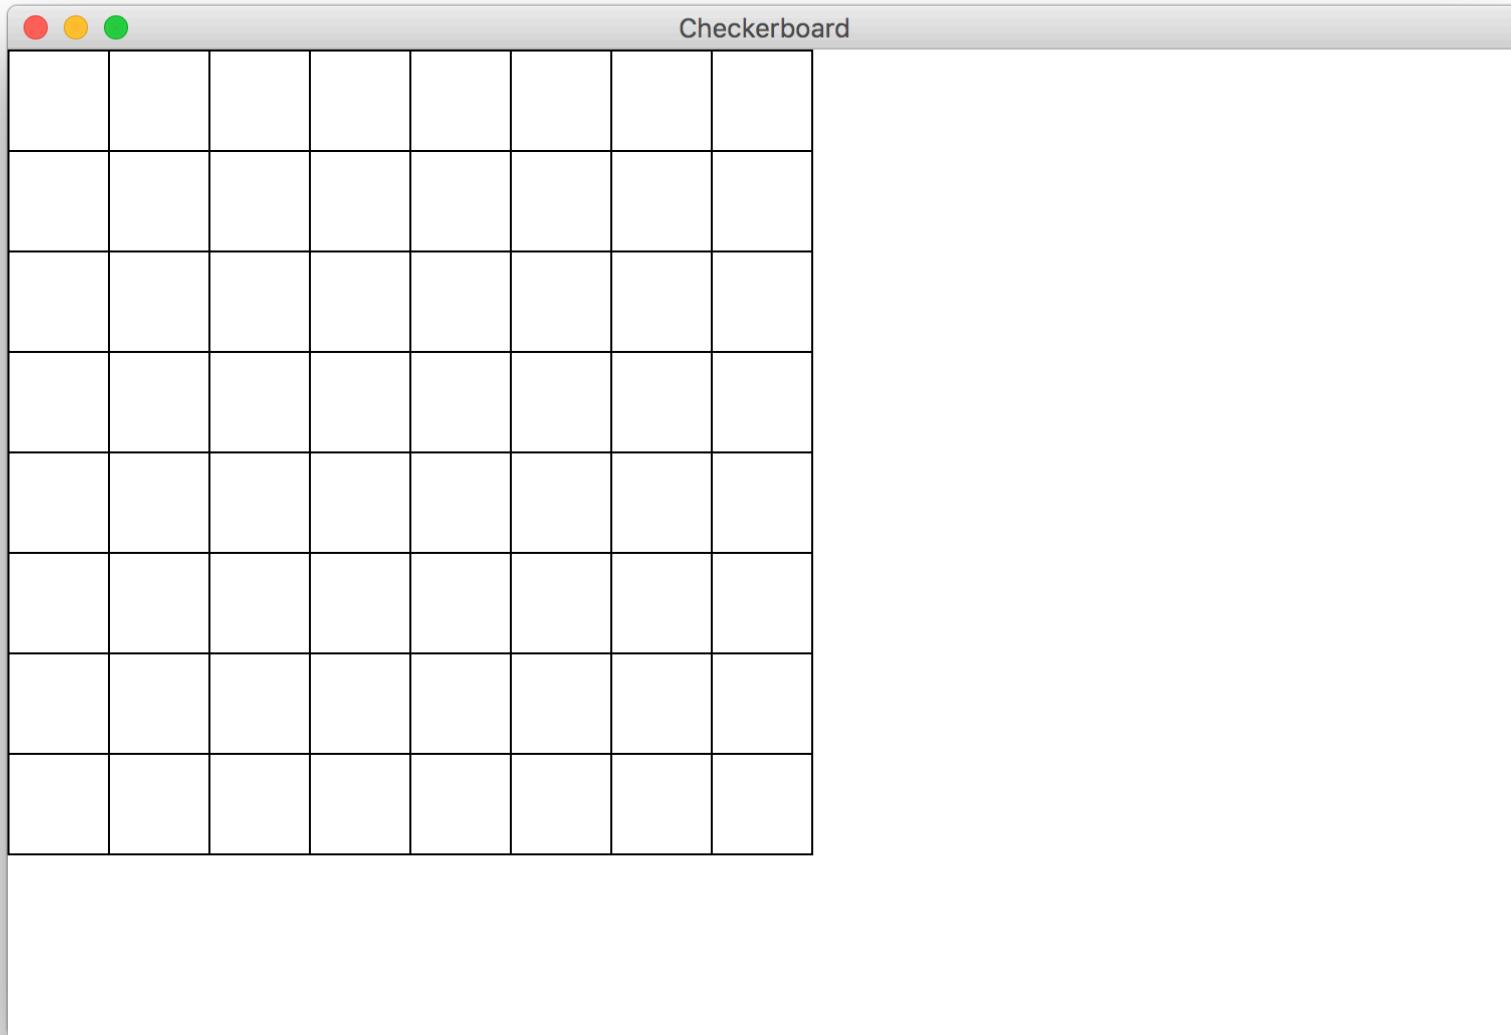

Write a graphical program named **Checkerboard** that draws a checkerboard pattern using GRects.

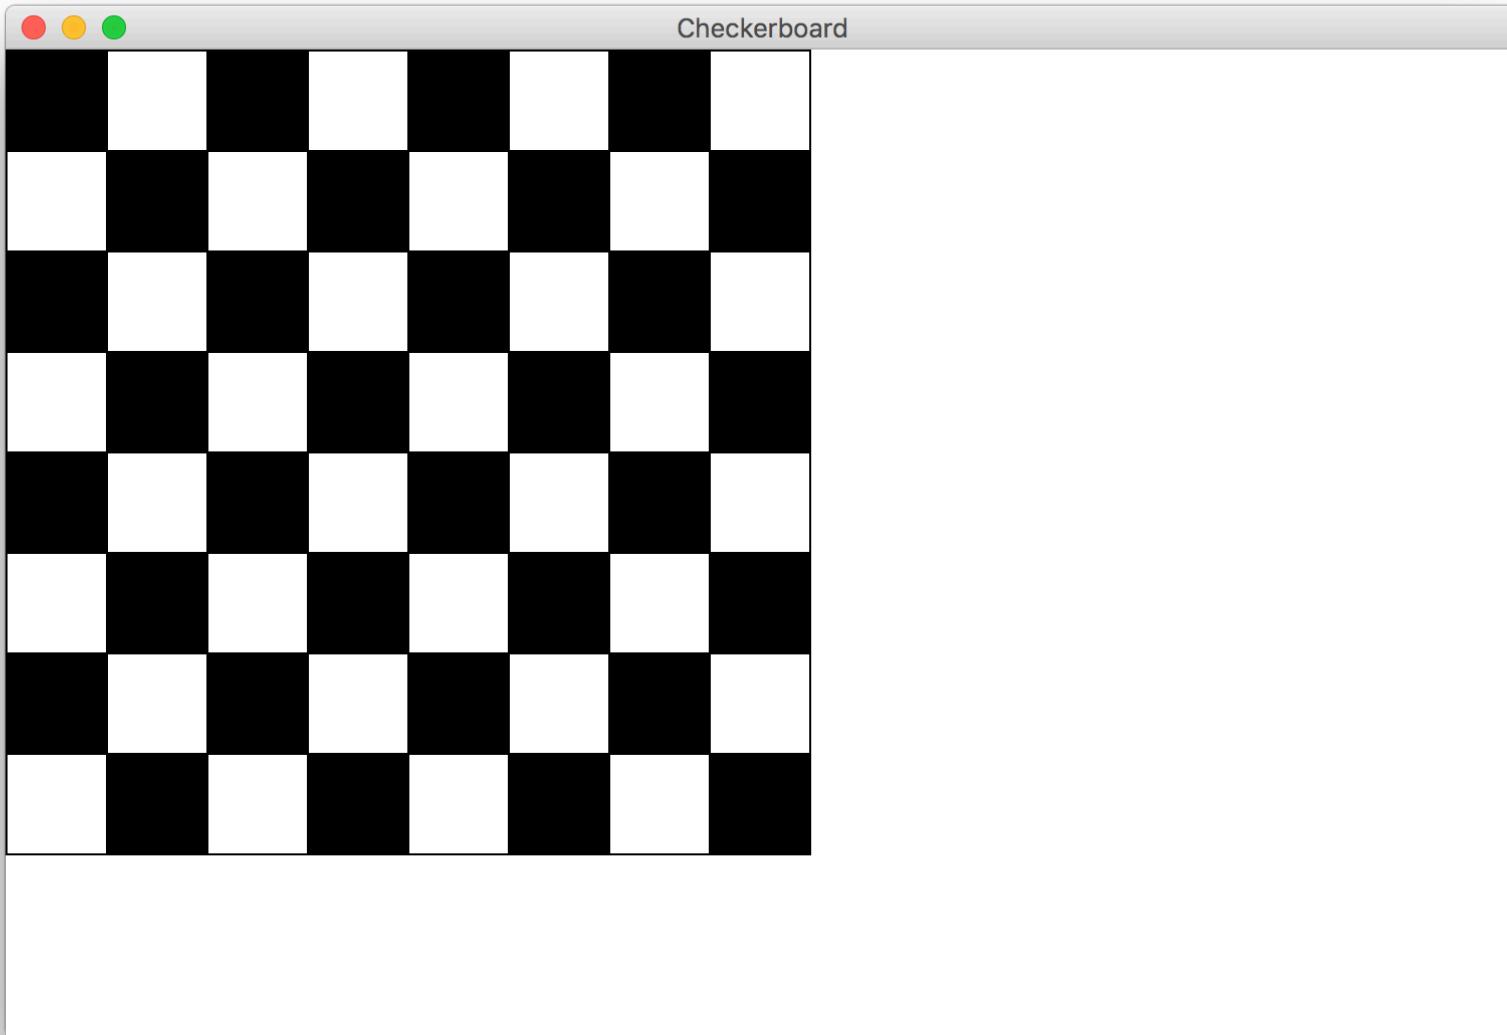

Milestone 1

Milestone 2

Milestone 3

Milestone 3

- Notice the pattern if we add the row and column indexes...

	0	1	2	3	4	5	6	7
0	0							
1	1	2						
2		3	4					
3			5	6				
4				7	8			
5					9	10		
6						11	12	6 + 6 ←
7							13	14
